

# UHT milk for schools

US schools use a lot of milk. About 403 million gallons per year, to be specific. For milk producers, there are plenty of opportunities to explore. However, delivering chilled milk to schools has its challenges – distribution is complex, the milk needs to be consumed within a couple of days and up to 30% of the milk goes to waste.

## The solution

Ultra High Temperature (UHT) treatment, a sterilisation process that efficiently eradicates harmful bacteria.

Long shelf-life and ambient aseptic packaging make UHT milk a profitable and efficient school milk option.

## Logistics made easy

With UHT treatment and aseptic packaging, distribution becomes more cost-efficient and easier to plan.

### Ambient convenience

UHT milk doesn't require a chilled distribution chain. The milk can be both transported and stored at room temperature – without any food safety concerns.

### No need for frequent deliveries

When unopened, aseptic packaging keeps UHT milk stays safe for up to six months. Long product shelf life equals minimised delivery frequency. And it means less waste, too.

### Easy transport

The compact, rectangular cartons feature a 3% package-to-product weight ratio and flat tops. That makes them perfect for pallet stacking and efficient transports.

## Less lactose

With 10-15% of all Americans being lactose intolerant, offering schools lactose reduced milk makes a lot of sense. And the good news is, switching from regular to lactose reduced UHT milk is both easy and comparatively inexpensive.

It is achieved through aseptic dosing of lactase – an enzyme that breaks down the lactose in milk. This is particularly suitable for flavoured options such as chocolate milk, as the lactase gives the milk a slightly sweeter taste. Most kids have no complaints about that.

## Reduce your environmental impact

No need for chilled distribution, less product waste and recyclable cartons – aseptic packaging has positive effects on your carbon footprint. You can reduce your greenhouse gas emissions by 28.5%.

Furthermore, the minimised delivery frequency helps decrease the CO<sup>2</sup> emissions to the equivalent of 248 driving miles.
